

ABSTRACT OF THE DISCLOSURE

- 5 A mobile telephone is connected to a private base in the same way as it is connected to a mobile telephone network. The base is connected to another telephone network. The user employs the same interface, i.e. the telephone, to set parameters of services of either network. When the telephone is connected to it, the base provides an interface between the second network and requests sent via the telephone. A server of the second network can therefore process requests from the mobile telephone and the base can therefore manage acknowledgements from the server on-line or off-line and without interfering with a call.
